Perform IT Project Audit and generate a report using open-source tools.

Date:

AIM:

To perform an IT project audit using open-source tools by examining project activities, identifying risks and issues, evaluating compliance and performance, and generating a comprehensive audit report.

ALGORITHM:

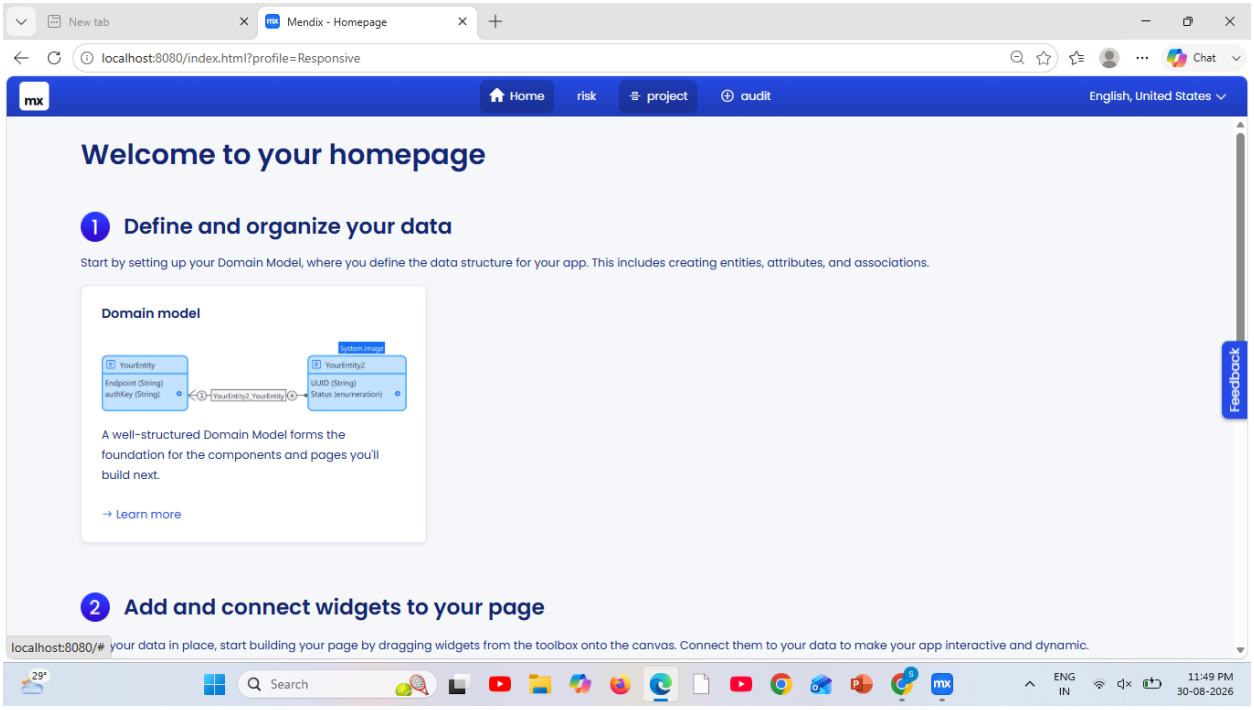

- Start the open-source IT project auditing tool.
- Create or import the IT project to be audited.
- Collect project information such as scope, schedule, resources, cost, and deliverables.
- Define the audit criteria and objectives.
- Examine project documentation, processes, and activities.
- Identify risks, issues, deviations, and compliance gaps.
- Evaluate project performance against the defined criteria.
- Record audit findings with their severity and recommendations.
- Generate the IT project audit report containing findings, risks, and corrective actions.
- Review and save the final audit report, then stop.

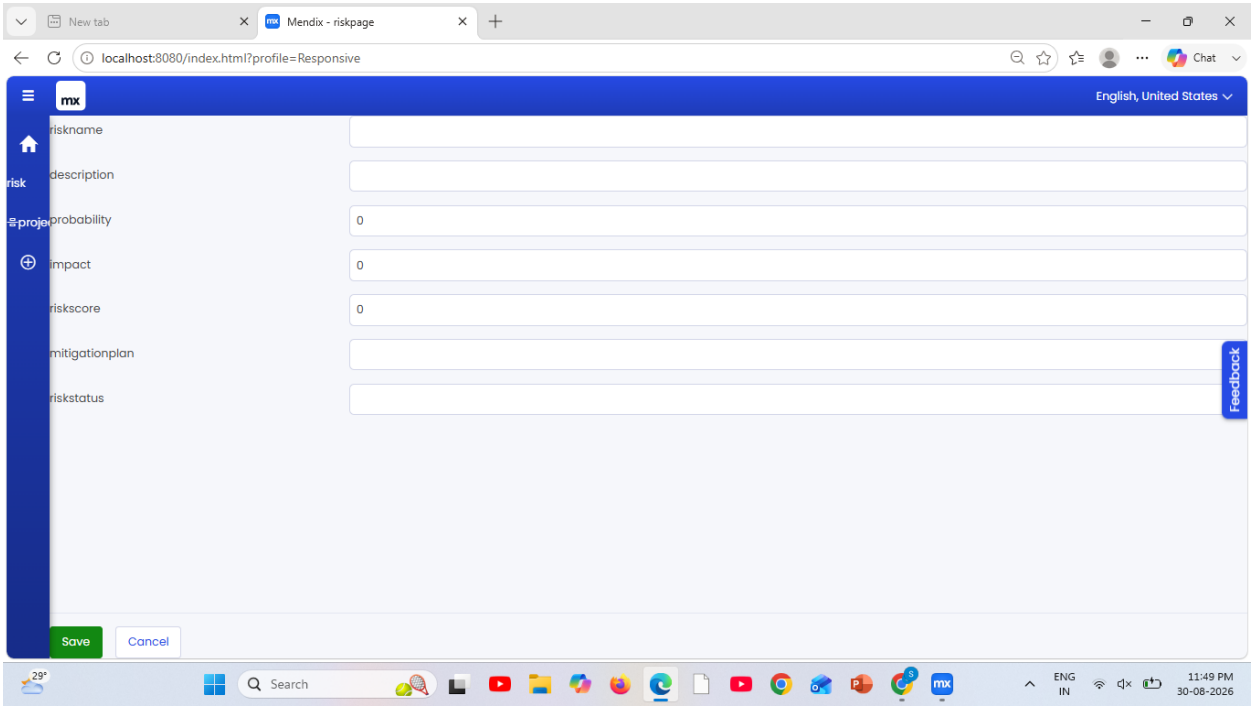

PROCEDURE:

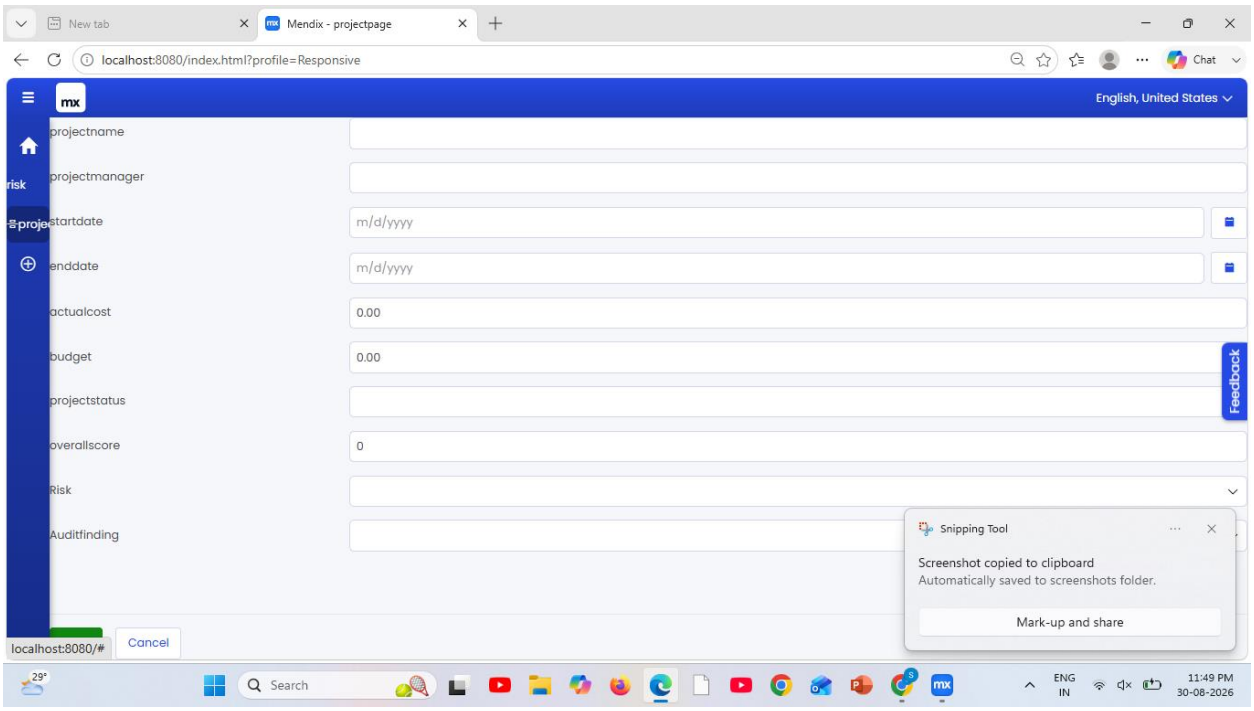

- Open the selected **open-source** IT project auditing tool and create a new audit project.
- Enter the project details such as **project name, objectives, team, timeline, and deliverables**.
- Define the **audit scope, objectives, and evaluation criteria**.
- Import or enter relevant project documents, task details, schedules, and resource information.
- Review the project activities and compare the actual progress with the planned progress.
- Check the project for **risks, security issues, quality problems, cost deviations, and schedule delays**.
- Record each identified finding and assign an appropriate **severity level** such as Low, Medium, or High.
- Provide suitable recommendations and corrective action**s** for the identified issues.

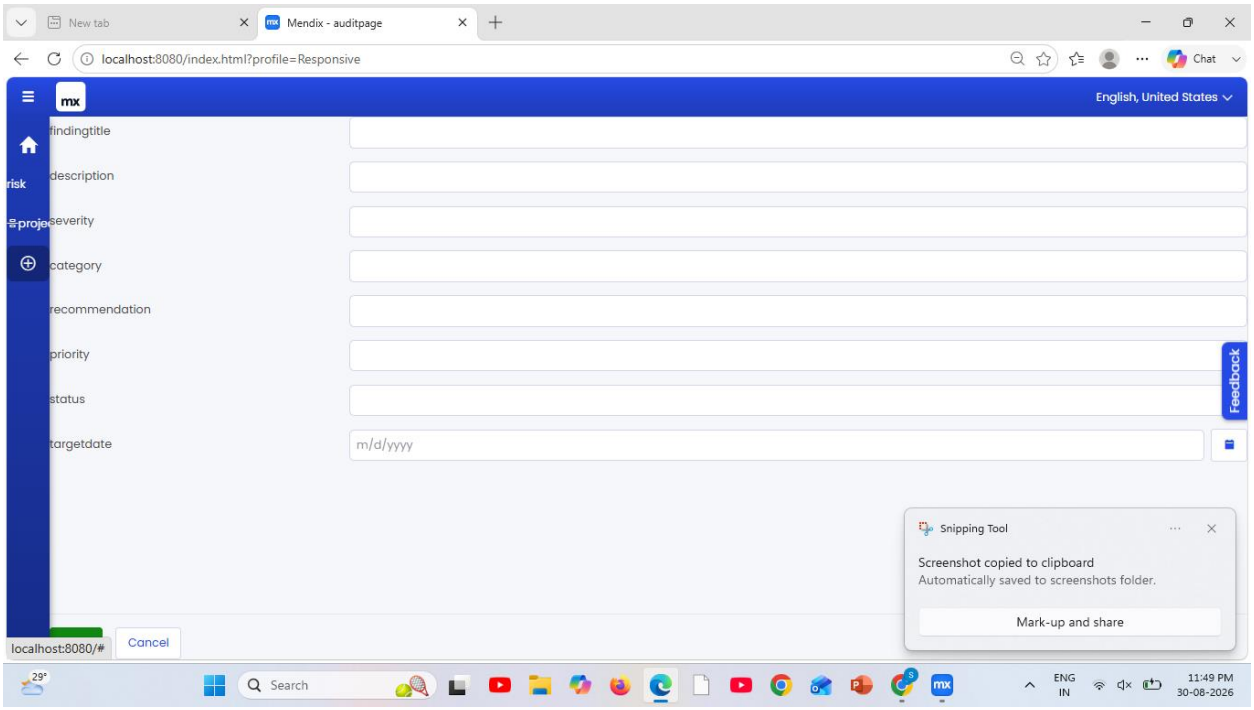

- Generate the IT Project Audit Report containing project details, audit findings, risk levels, recommendations, and overall assessment.
- Review the generated report, save/export it, and verify that the audit results are complete and accurate.
